

AP CHEMISTRY

TOPIC 3: GASES, PART A, EXAMPLE PROBLEMS

Day 34:

- Boyle, Charles, and Avogadro: Gas Laws
 - Ideal Gas Law
-

1) During Hurricane Katrina, the atmospheric pressure (barometric pressure) within the eye dropped to 27.33 inches of mercury. Express this pressure in each of the following units:

- a) mm Hg b) atm c) kPa d) torr

$$\frac{27.33 \text{ in Hg}}{1 \text{ in Hg}} \times \frac{2.54 \text{ cm Hg}}{1 \text{ cm Hg}} \times \frac{10 \text{ mm Hg}}{1 \text{ cm Hg}} = 694 \text{ mm Hg}$$

$$\frac{27.33 \text{ in Hg}}{1 \text{ in Hg}} \times \frac{2.54 \text{ cm Hg}}{1 \text{ cm Hg}} \times \frac{10 \text{ mm Hg}}{1 \text{ cm Hg}} \times \frac{1 \text{ atm}}{760 \text{ mm Hg}} = 0.913 \text{ atm}$$

$$\frac{27.33 \text{ in Hg}}{1 \text{ in Hg}} \times \frac{2.54 \text{ cm Hg}}{1 \text{ cm Hg}} \times \frac{10 \text{ mm Hg}}{1 \text{ cm Hg}} \times \frac{1 \text{ kPa}}{7.501 \text{ mm Hg}} = 92.5 \text{ kPa}$$

$$\frac{27.33 \text{ in Hg}}{1 \text{ in Hg}} \times \frac{2.54 \text{ cm Hg}}{1 \text{ cm Hg}} \times \frac{10 \text{ mm Hg}}{1 \text{ cm Hg}} \times \frac{1 \text{ torr}}{1 \text{ mm Hg}} = 694 \text{ torr}$$

2) The volume of a balloon is 485 mL when filled with 0.0222 moles of helium gas fills at temperature of 20.0 °C. What is the pressure that the helium atoms are exerting on the sides of this balloon?

$$PV = nRT$$

$$\frac{485 \text{ mL}}{1000 \text{ mL}} \times \frac{1 \text{ L}}{1000 \text{ mL}} = 0.485 \text{ L} ; 20.0^{\circ}\text{C} + 273 = 293 \text{ K} ;$$

$$R = 0.0821 \frac{\text{atm} \cdot \text{L}}{\text{mol} \cdot \text{K}}$$

$$P = \frac{nRT}{V} = \frac{(0.0222 \text{ mol})(0.0821 \text{ atm} \cdot \text{L})(293 \text{ K})}{(0.485 \text{ L})(\text{mol} \cdot \text{K})} = 1.10 \text{ atm}$$

- 3) When 5.27 moles of nitrogen gas at 745 mm Hg of pressure at a volume of 2.00 L is compressed to a new pressure of 300. kPa – what will be the new volume for the nitrogen?

$$\begin{array}{l}
 P_1 = 745 \text{ mm Hg} \\
 V_1 = 2.00 \text{ L} \\
 n_1 = 5.27 \text{ mol} \\
 T_1 = T_2 \\
 \hline
 P_2 = 300 \text{ kPa} \\
 V_2 = ? \\
 n_2 = n_1 \\
 T_2 = T_1
 \end{array}$$

$$\begin{array}{l}
 P_1V_1 = nRT \\
 P_2V_2 = nRT
 \end{array}$$

$$P_1V_1 = nRT = P_2V_2$$

$$\begin{array}{c}
 P_1V_1 = P_2V_2 \\
 V_2 = \frac{P_1V_1}{P_2} = \frac{(99.32 \text{ kPa})(2.00 \text{ L})}{300 \text{ kPa}} = 0.662 \text{ L}
 \end{array}$$

$$\frac{745 \text{ mm Hg}}{7.501 \text{ mm Hg}} \times \frac{1 \text{ kPa}}{7.501 \text{ mm Hg}} = 99.32 \text{ kPa}$$

- 4) Determine the temperature of the gas if a sample of oxygen gas with an original volume of 4.55 liters and at a temperature of -45°C has its volume reduced to 2.00 liters.

$$\begin{array}{l}
 P_1 = P_2 \\
 V_1 = 4.55 \text{ L} \\
 n_1 = n_2 \\
 T_1 = -45^\circ\text{C} \\
 \hline
 P_2 = P_1 \\
 V_2 = 2.00 \text{ L} \\
 n_2 = n_1 \\
 T_2 = ?
 \end{array}$$

$$\begin{array}{l}
 PV_1 = nRT_1 \\
 PV_2 = nRT_2
 \end{array}$$

$$-45^\circ\text{C} + 273 = 228 \text{ K}$$

$$PV_1 = nRT_1 ; P = \frac{nRT_1}{V_1} ; \frac{P}{nR} = \frac{T_1}{V_1} ; \frac{T_1}{V_1} = \frac{T_2}{V_2}$$

$$\frac{T_1}{V_1} = \frac{T_2}{V_2}$$

$$T_2 = \frac{T_1V_2}{V_1} = \frac{(228 \text{ K})(2.00 \text{ L})}{4.55 \text{ L}} = 100. \text{ K}$$
