1. Calculate the pH of each of the following strong acids in water.
a) $0.10 \mathrm{M} \mathrm{HCl}:\left[\mathbf{H}^{+}\right]=\mathbf{0 . 1 0} \mathbf{M}, \mathbf{p H}=-\boldsymbol{\operatorname { l o g }}(\mathbf{0 . 1 0})=\mathbf{1 . 0 0}$
b) $5.0 \times 10^{-4} \mathrm{MHCl}:\left[\mathbf{H}^{+}\right]=5.0 \times 10^{-4} \mathbf{M}, \boldsymbol{p H}=-\boldsymbol{l o g}\left(5.0 \times 10^{-4}\right)=3.30$
c) $1.0 \times 10^{-11} \mathrm{MHCl}:\left[\mathbf{H}^{+}\right]=\mathbf{1 . 0} \times \mathbf{1 0}^{-\mathbf{1 1}} \mathbf{M}, \boldsymbol{p H}=-\log \left(\mathbf{1 . 0} \times \mathbf{1 0}^{-11}\right)=\mathbf{1 1 . 0 0}$
2. A solution is prepared by adding 50.0 mL of 0.0500 M HCl to 150 mL of $0.10 \mathrm{M} \mathrm{HNO}_{3}$. Calculate the concentrations of all the species in this solution. (hint: do a dissociation for each strong acid, AND recall what the solvent for these acids, $\mathrm{H}_{2} \mathrm{O}$.)

Answers: $\quad$ Strong Acids $=100 \%$ dissociation, $\quad$ Total Volume $=200 \mathrm{~mL}=0.2 \mathrm{~L}$
$\boldsymbol{H C l}: \frac{50 \mathrm{~mL}}{} \times \frac{1 \mathrm{~L}}{1000 \mathrm{~mL}} \times \frac{0.05 \mathrm{~mol}}{L}=0.0025 \mathrm{~mol} \quad \mathbf{H C l} \rightarrow \boldsymbol{H}^{+\boldsymbol{1}}+\mathrm{Cl}^{-1}$
$\boldsymbol{H N O}_{3}: \frac{150 \mathrm{~mL}}{} \times \frac{1 \mathrm{~L}}{1000 \mathrm{~mL}} \times \frac{0.10 \mathrm{~mol}}{L}=0.015 \mathrm{~mol}$

$$
\mathrm{HNO}_{3} \rightarrow \mathrm{H}^{+1}+\mathrm{NO}_{3}^{-1}
$$

$$
\begin{aligned}
& {\left[\mathbf{C l}^{\mathbf{- 1}}\right]=\frac{0.0025 \mathrm{~mol}}{0.2 \mathrm{~L}}=0.0125 \mathrm{M}} \\
& {\left[\mathbf{N O}_{3}^{-\mathbf{1}}\right]=\frac{0.015 \mathrm{~mol}}{0.2 \mathrm{~L}}=0.075 \mathrm{M}} \\
& {\left[\mathbf{H}^{+\mathbf{1}}\right]=\frac{(0.015 \mathrm{~mol}+0.0025 \mathrm{~mol})}{0.2 \mathrm{~L}}=0.0875 \mathrm{M}}
\end{aligned}
$$

3. Calculate the concentration of an aqueous HCl solution that has a $\mathrm{pH}=2.50$.

$$
\left[\mathrm{H}^{+1}\right]=\operatorname{Antilog}(-2.50)=3.16 \times 10^{-3} \mathrm{M}
$$

HCl is a strong acid, 100 \% dissociation

$$
\mathrm{HCl} \rightarrow \mathrm{H}^{+1}+\mathrm{Cl}^{-1}
$$

Therefore, $[\mathrm{HCl}]=\left[\mathrm{Cl}^{-1}\right]=\left[\mathrm{H}^{+1}\right]$
4. A 0.20 M solution of acetic acid has a $K_{a}=1.8 \times 10^{-5}$. Calculate the concentration of all the species present in the solution. Also, calculate the pH .

5. Calculate the $\left[\mathrm{H}^{+}\right]$and $\left[\mathrm{OH}^{-}\right]$for each solution.
a) $\mathrm{pH}=7.41$ (normal pH for blood),

$$
\left[\mathbf{H}^{+1}\right]=\operatorname{Antilog}(-7.41)=3.89 \times 10^{-8} \mathbf{M},\left[O H^{-1}\right]=\frac{1.00 \times 10^{-14}}{3.89 \times 10^{-8}}=2.57 \times 10^{-7} \mathrm{M}

6. Boric acid, $\mathrm{H}_{3} \mathrm{BO}_{3}$ is commonly used in eyewash solutions in chemistry laboratories to neutralize bases splashed in the eye. It acts as a monoprotic acid, but the dissociation reaction is slightly different from that of other acids.

$$
\mathrm{B}(\mathrm{OH})_{3(\mathrm{aq})}+\mathrm{H}_{2} \mathrm{O}_{(\mathrm{l})} \leftrightarrow \mathrm{B}(\mathrm{OH})_{4}^{-1}{ }_{(\mathrm{aq})}+\mathrm{H}^{+}{ }_{(\mathrm{aq})} \quad K_{a}=5.8 \times 10^{-10}

7. Hypobromous acid, HOBr , is a weak acid that dissociates in water, as represented in the equation below:

$$
\operatorname{HOBr}_{(\mathrm{aq)}} \leftrightarrow \mathrm{H}^{+}{ }_{(\mathrm{aq})}+\mathrm{OBr}^{-}(\mathrm{aq}) \quad K_{a}=2.3 \times 10^{-9}
