

HOMEWORK PROBLEMS:

- 1a. How many moles of H_2SO_4 are dissolved in 4.95 liters of a 2.33 M H_2SO_4 solution?

Answers:

If you are given the volume and molarity, and you KNOW the value of these two values – START with the volume. This will allow you to cancel out the volume unit and be left with the unit moles. This is a practice you must MASTER !!!

$$\frac{4.95 \text{ L}}{1} \times \frac{2.33 \text{ mol } H_2SO_4}{L} = 11.5 \text{ mol } H_2SO_4$$

- 1b. How many moles of sodium chloride are dissolved in 1.75 liters of a 1.40 M NaCl solution?

Answers:

$$\frac{1.75 \text{ L}}{1} \times \frac{1.40 \text{ mol NaCl}}{L} = 2.45 \text{ mol NaCl}$$

- 1c. How many grams are in 1.25 liters of a 1.64 M copper(II) sulfate solution?

Answers:

$$\frac{1.25 \text{ L}}{1} \times \frac{1.64 \text{ mol } CuSO_4}{L} \times \frac{159.61 \text{ g}}{1 \text{ mol } CuSO_4} = 327 \text{ g } CuSO_4$$

- 1d. How many grams of HCl are in 1.56 liters of a 9.32 M HCl solution?

Answers:

Again, solving for this type of problem is the same as above, we are just adding one more step – converting the moles to mass (grams)...

$$\frac{1.56 \text{ L}}{1} \times \frac{9.32 \text{ mol HCl}}{L} \times \frac{36.458 \text{ g}}{1 \text{ mol HCl}} = 530. \text{ g } HCl$$

- 1e. What is the molarity of a NaOH solution where 10.3 g of sodium hydroxide is dissolved in a 300. mL volume?

Answers:

You have two options for solving this problem: The first is demonstrated below – the “build it” technique... First find the number of moles and then determine the volume and then place the two values together... I highly recommend this method until you fully understand molarity...

$$\frac{10.3 \text{ g NaOH}}{39.998 \text{ g NaOH}} \times \frac{1 \text{ mol NaOH}}{1 \text{ mol NaOH}} = 0.2575 \text{ mol NaOH}$$

$$\frac{300. \text{ mL}}{1000. \text{ mL}} \times \frac{1 \text{ L}}{1 \text{ L}} = 0.300 \text{ L}$$

$$M = \frac{\text{mol}}{\text{L}} = \frac{0.2575 \text{ mol NaOH}}{0.300 \text{ L}} = 0.858 \frac{\text{mol}}{\text{L}} = 0.858 \text{ M NaOH}$$

The second method is to place all the values together and then solve. ONLY do this once you understand molarity...

$$\frac{10.3 \text{ g NaOH}}{300 \text{ mL}} \times \frac{1 \text{ mol NaOH}}{39.998 \text{ g NaOH}} \times \frac{1000 \text{ mL}}{1 \text{ L}} = 0.858 \text{ M NaOH}$$

- 1f. What is the molarity of a solution where 23.4 g of nickel(II) carbonate is dissolved in a solvent with 1.72 liters of volume?

Answers:

$$\frac{23.4 \text{ g NiCO}_3}{118.94 \text{ g NiCO}_3} \times \frac{1 \text{ mol NiCO}_3}{1 \text{ mol NiCO}_3} = 0.1967 \text{ mol NiCO}_3$$

$$M = \frac{\text{mol}}{\text{L}} = \frac{0.1967 \text{ mol NiCO}_3}{1.72 \text{ L}} = 0.114 \frac{\text{mol}}{\text{L}} = 0.114 \text{ M NiCO}_3$$

OR

$$\frac{23.4 \text{ g NiCO}_3}{1.72 \text{ L}} \times \frac{1 \text{ mol NiCO}_3}{118.94 \text{ g NiCO}_3} = 0.114 \text{ M NiCO}_3$$
