

HOMEWORK PROBLEMS:

What are the Empirical Formulas for the two sulfur oxide compounds (in parts 3a and 3b) having the following compositions?

3a.) a 27.0 g sample that is 50% sulfur by mass.

Answers:

$$\frac{13.5 \text{ g S}}{32.06 \text{ g}} \times \frac{1 \text{ mol S}}{1 \text{ mol S}} = 0.421 \text{ mol S}$$

$$\frac{13.5 \text{ g O}}{16.0 \text{ g}} \times \frac{1 \text{ mol O}}{1 \text{ mol O}} = 0.844 \text{ mol O}$$

$$\frac{0.421 \text{ mol}}{0.421 \text{ mol}} = 1.0$$

$$\frac{0.844 \text{ mol}}{0.421 \text{ mol}} = 2.0$$

OR, you can ignore the given mass and have to consider the percentage. A quicker method is to simply take the percentages (that "should" add up to 100%) and make the percentages the mass for each element.

$$\frac{50 \text{ g S}}{32.06 \text{ g}} \times \frac{1 \text{ mol S}}{1 \text{ mol S}} = 1.560 \text{ mol S}$$

$$\frac{50 \text{ g O}}{16.0 \text{ g}} \times \frac{1 \text{ mol O}}{1 \text{ mol O}} = 3.125 \text{ mol O}$$

$$\frac{1.560 \text{ mol}}{1.560 \text{ mol}} = 1.0$$

$$\frac{3.125 \text{ mol}}{1.560 \text{ mol}} = 2.0$$

3b.) a 78.0 g sample that is 60% oxygen.

Answers:

$$\frac{40 \text{ g S}}{32.06 \text{ g}} \times \frac{1 \text{ mol S}}{1 \text{ mol S}} = 1.2477 \text{ mol S}$$

$$\frac{60 \text{ g O}}{16.0 \text{ g}} \times \frac{1 \text{ mol O}}{1 \text{ mol O}} = 3.75 \text{ mol O}$$

$$\frac{1.2477 \text{ mol}}{1.2477 \text{ mol}} = 1.0$$

$$\frac{3.75 \text{ mol}}{1.2477 \text{ mol}} = 3.0$$

3c.) Calculate the Empirical formula of a compound that contains 1.67 grams of cerium, Ce, and 4.54 grams of iodine.

Answers:

$$\frac{1.67 \text{ g Ce}}{140.12 \text{ g}} \times \frac{1 \text{ mol Ce}}{1} = 0.01191 \text{ mol Ce}$$

$$\frac{4.54 \text{ g I}}{126.91 \text{ g}} \times \frac{1 \text{ mol I}}{1} = 0.03577 \text{ mol I}$$

$$\frac{0.01191 \text{ mol}}{0.01191 \text{ mol}} = 1.0$$

$$\frac{0.03577 \text{ mol}}{0.01191 \text{ mol}} = 3.0$$

3d.) A synthetic rubber contains 0.556 grams of carbon and 0.0933 grams of hydrogen. Determine its Empirical Formula.

Answers:

$$\frac{0.556 \text{ g C}}{12.01 \text{ g}} \times \frac{1 \text{ mol C}}{1} = 0.04629 \text{ mol C}$$

$$\frac{0.0933 \text{ g H}}{1.008 \text{ g}} \times \frac{1 \text{ mol H}}{1} = 0.09256 \text{ mol H}$$

$$\frac{0.04629 \text{ mol}}{0.04629 \text{ mol}} = 1.0$$

$$\frac{0.09256 \text{ mol}}{0.04629 \text{ mol}} = 2.0$$
